

Overview

Incinerators will be installed at strategic locations (e.g., landfills) to provide for the burning of hazardous and non-hazardous waste, as appropriate, generated by various Project-related activities. Prior to accepting waste at these incinerators, an incinerator-specific "Incinerator Operating Plan" will be prepared. Although the final plan will not be completed until final incinerator design and construction, the plan will address the issues described below.

Training

Prior to the incinerator receiving the first waste, incinerator operators will be trained on appropriate waste management procedures and on the proper operating procedures as they relate to the operator's job responsibilities.

After the incinerator begins operations, new operators or personnel changing positions will be trained on their responsibilities through classes and/or on-the-job training.

Key Elements

On a site-specific basis, the "Incinerator Operating Plan" will describe, and personnel will be trained as appropriate, on the following topics:

- Procedures to review the incoming waste and its associated paperwork (e. g., manifest) to verify the waste is as described, that it is acceptable to be received, and to be able to direct the waste to the incinerator, non-hazardous waste cell or the hazardous waste cell, as appropriate.
- Procedures for waste unloading and segregation pending incineration or disposal.
- Procedures for loading the waste into the incinerator (e.g., types of waste, quantity of waste, "compatibility" and heat-load of waste, etc.) and for recording operating parameters (e.g., temperature, weight burned, etc.).
- Procedures for the proper operation and monitoring of the incinerator control systems (e.g., temperature, etc.), where installed.
- Procedures for the handling, storage and disposal of incinerator ash.
- Recordkeeping procedures.

Recordkeeping

Records will be maintained including:

- Copies of the manifests for the wastes received.
- An operations log book identifying appropriate information (e.g., types and quantities of waste received, quantity burned, etc.)
